## Letting drivers pay to avoid expressway delays

Chicago-area commuters spend an estimated 71 hours a year sitting in traffic. "Congestion-priced" lanes can help alleviate that. (Heather Charles, Chicago Tribune / October 10, 2012)

October 29, 2012

If you've ever been mired in a major traffic jam on a Chicago expressway — meaning, if you commuted during rush hour last week — you've probably daydreamed about ways to reach your destination. A helicopter? A jetpack? Teleportation? Then you've returned to the more plausible prospect: that the prevalence of terrible traffic may get worse but will never get better.

That may seem inescapable. As the metropolitan population grows, the volume of cars on the road increases as well. Providing mass transit doesn't seem to make much difference. Advertising the benefits of carpooling rarely works. Telecommuting turns out to be no big help.

Neither is the obvious option of building more highways. Expanded capacity may reduce travel times, but those induce more people to drive, which fills the new capacity until things are as bad as ever. Unless a few hundred thousand locals suddenly pack up and head for Texas, we appear to be stuck.

But maybe not. Transportation planners have long been attracted to an alternative that would charge drivers for the privilege of bypassing heavy traffic. It's called "congestion pricing," and

it could be on the way here.

The idea is being floated by the Chicago Metropolitan Agency for Planning as a way to pay for, and make the best use of, new lanes on six major Chicago-area roadways. These lanes would be "congestion-priced" in such a way as to assure that traffic would always flow at the posted speed limit of 55 mph.

In this scenario, a commuter would cut the drive on the Stevenson Expressway from I-355 and the Dan Ryan in half — from 51 minutes (the current morning rush hour average) to 26 minutes. Eisenhower drivers would zip from Mannheim Road to Damen Avenue in 12 minutes, down from 35.

Skeptics will see this as an excuse to gouge motorists who are already saddled with high gasoline prices, heavy fuel taxes and toll charges. Actually, one attraction of the idea is that if you would rather save the money, you'd have as many lanes available as you do now. Only the people who put a higher priority on their time would have to pay.

But here's another attraction: Even tightfisted drivers would benefit, since the express lanes would siphon cars out of the regular lanes enough to speed up travel there. The innovation is also projected to reduce traffic on main roads close to the expressways.

If you're worried about being gouged, it's reassuring to hear that the extra cost of a faster journey would not be prohibitive — \$2.76 per trip on the Stevenson and \$3.41 on the Eisenhower. Studies of congestion-priced lanes in other cities indicate that even low-income drivers find them worth the cost when time is short.

If congestion pricing were applied to existing roads it would be less attractive, since it would force drivers to pay more for the same pavement. Introducing it solely on additional lanes or roads would mean nobody would be worse off than now — while some, and perhaps all, would be better off.

It's heartening to see planners devise imaginative, economically sound ways to deal with the Chicago area's notorious traffic delays — which the Reason Foundation says have gone from 18 hours a year per commuter in 1982 to 71 hours today.

We could see if we can make that 100 hours. Or we could take a look at something different. The Chicago Metropolitan Agency for Planning deserves credit for doing the latter.
